*DATE:.....*

**CERTIFICATE**

This is to certify that the work embodied in this project entitled, **“Boat Booking System (BBS)”** being submitted by **Ankush Singh (22303310237)** in partial fulfillment of the requirement for the award of **“Bachelor of Computer Applications”** to **Aryabhatta Knowledge University, Patna, Bihar** during the academic year 2022-25 is a record of bonafide piece of work, carried out by him/her under our/my supervision and guidance in the **“Department of Computer Applications”, CIMAGE PROFESSIONAL COLLEGE.**

**Dr. Neeraj Agrawal**  
Director of CIMAGE

**Er. Amit Kr. Shukla**  
Head of Department-IT

**Dr. Pawan Kumar Jha**  
Principal

**CIMAGE PROFESSIONAL COLLEGE**  
**Department of Computer Applications**  
**Session : 2022-2025**

---

Date: \_\_\_\_\_

**APPROVAL CERTIFICATE**

The project report entitled **“Boat Booking System”**, being submitted by **Ankush Singh** (Registration number: **22303310237**) has been examined by us and is hereby approved for the award of degree **“Bachelor of Computer Applications”**, for which it has been submitted. It is understood that by this approval the undersigned do not necessarily endorse or approve any statement made, the opinion expressed or conclusion drawn therein, but approve the project only for the purpose for which it has been submitted.

(Internal Examiner)

(External Examiner)

Date: \_\_\_\_\_

**DECLARATION**

I, **Ankush Singh** hereby declare that the work, which is being presented in the project report entitled “**Boat Booking System (BBS)**”, partial fulfillment of the requirements for the award of degree of “**Bachelor of Computer Applications**” submitted in the department of **Computer Science & Information Technology (Cimage Professional College)** is an authentic record of my own work carried under the joint guidance of **Prof. Ravi Kumar Soni Sir and Prof. Amit Shukla Sir**. I have not submitted the matter embodied in this report for the award of any other degree.

**Ankush Singh**  
**Registration No : 22303310237**  
**BCA AKU 6th Semester**  
**Session : 2022-2025**

### ACKNOWLEDGEMENT

*“A journey is easier when you travel together. Interdependence is certainly more valuable than independence.”*

I would like to thank **Prof. Ravi Kumar Soni Sir** and **Er. Amit Kumar Shukla Sir**, for providing regular guidance and insight into my project work. I also thank them for all the advice he has given me in the past year, and for always having time for me, whenever I needed it.

I give special thanks to **Er. Amit Kumar Shukla Sir**, **Prof. Raju Upadhyay Sir**, and **Prof. Pankaj Chandra Sir** for always being willing to help find solutions to any problems I had with my work.

*“The completion of any project depends upon the cooperation, coordination, and combined efforts of several resources of knowledge, inspiration, and energy”.*

I also extend my deepest gratitude to the Director, CIMAGE GROUP OF INSTITUTIONS, PATNA, **Dr. Neeraj Agrawal Sir**, Dean, CIMAGE GROUP OF INSTITUTIONS, PATNA, **Dr. Neeraj Kumar Sir** and Centre Head, **Mrs. Megha Agrawal Ma'am** for providing all the necessary facilities and true encouraging environment to bring out the best in my endeavors.

I express my gratitude and thanks to all the staff members of Computer Science departments for their sincere cooperation in furnishing relevant information to complete this Project well in time successfully.

I extend a special word to my friends, who have been a constant source of inspiration throughout my project work.

Lastly but not least I must express my cordial thanks to my parents and family members who gave me the moral support without that it is impossible to complete my project work. With this note, I thank everyone for the support.

**Ankush Singh**

## INTRODUCTION TO BOAT BOOKING SYSTEM

The “Boat Booking System” is a web-based application designed to streamline the process of renting and managing boat reservations for both customers and boat operators. This system provides an intuitive platform where users can browse available boats, check schedules, and book rentals based on real-time availability. The system allows customers to select boats based on type, location, rental duration, and additional services.

For boat operators, the system offers comprehensive management tools, including the ability to add new boats, update availability, manage customer reservations, and track overall bookings. The platform also incorporates essential features such as online payment integration, booking status notifications, and user reviews, all aimed at enhancing the customer experience.

The system significantly reduces manual processes, eliminates issues related to double-booking, and offers a convenient, paperless solution for both customers and operators. By automating the entire booking process, it enhances efficiency, accuracy, and overall customer satisfaction.

### **Key Features:**

- Real-time boat availability tracking
- User-friendly boat search and filtering
- Online reservation and cancellation system
- Secure payment gateway integration
- Booking history and status notifications
- Admin panel for boat and booking management

This system aims to simplify the boat rental process, increase booking efficiency, and provide a seamless experience for all users involved.

## OBJECTIVE

The primary objective of the Boat Booking System is to provide a secure, efficient, and user-friendly platform that simplifies the process of boat rentals for both customers and boat operators.

### The system aims to:

- **Streamline the Booking Process:** Offer customers an easy-to-use interface for browsing, selecting, and reserving boats based on their preferences, with real-time availability updates.
- **Enhance Operational Efficiency:** Enable boat operators to efficiently manage boat availability, customer reservations, and rental schedules through an intuitive admin panel, reducing manual errors and administrative tasks.
- **Ensure Secure Transactions:** Integrate a secure payment gateway to facilitate online payments, ensuring customer trust and safeguarding financial transactions.
- **Prevent Double Bookings:** Implement a real-time booking and scheduling system that eliminates the risk of overbooking or double-booking boats.
- **Improve Customer Satisfaction:** Provide customers with a seamless experience through features like booking confirmations, notifications, and cancellation options, while also allowing them to leave feedback and reviews.
- **Support Business Growth:** Equip boat rental companies with tools to track bookings, manage customer data, and expand their business by offering better service and optimized booking management.

By achieving these objectives, the Boat Booking System aims to improve the overall customer experience and operational efficiency for boat rental businesses.

## PROJECT CATEGORY PHP

PHP is a server-side scripting language originally developed by Rasmus Lerdorf in 1994 and later maintained by The PHP Group. PHP is a general-purpose programming language that is especially suited for web development and can be embedded into HTML. The language's syntax draws heavily from C, Java, and Perl, with a focus on simplicity and ease of use. PHP code is typically executed on a web server, and the resulting HTML is sent to the client's web browser.

PHP is widely used for creating dynamic web pages, web applications, and content management systems. It is considered one of the most popular programming languages for web development, powering many websites and applications. The PHP language is open-source and has a large community of developers who contribute to its development and maintenance.

## ADVANTAGES OF PHP

1. **PHP is Easy to Learn:** PHP is designed to be easy to use and is therefore easy to write, debug, and learn. PHP's syntax is simple and intuitive, making it a great language for beginners. With a vast array of built-in functions and a large community of developers, PHP is an ideal language for those new to programming.
2. **PHP is Flexible:** PHP is a flexible language that can be used for a wide range of applications, from simple scripts to complex web applications. PHP's flexibility makes it a popular choice among developers, and its ability to be embedded into HTML makes it easy to create dynamic web pages.
3. **PHP is Platform-Independent:** PHP is platform-independent, meaning that PHP code can run on any operating system that supports PHP, including Windows, macOS, and Linux. This makes it easy to develop and deploy PHP applications across different platforms.
4. **PHP is Open-Source:** PHP is open-source, which means that it is free to use and distribute. The open-source nature of PHP has led to a large community of developers who contribute to its development and maintenance, ensuring that PHP remains a popular and widely used language.

5. **PHP is Highly Scalable:** PHP is highly scalable, making it suitable for large and complex web applications. PHP's scalability is due in part to its ability to handle a large number of requests and its support for caching and other performance-enhancing technologies.
6. **PHP has Extensive Libraries and Frameworks:** PHP has a vast array of libraries and frameworks that make development easier and faster. Popular frameworks like Laravel, CodeIgniter, and Symfony provide a structure and set of tools that make it easier to build complex web applications.
7. **PHP is Dynamic:** PHP is a dynamic language, which means that it can execute code at runtime. This makes it easy to create dynamic web pages and applications that can respond to user input and changing data.
8. **PHP has a Large Community:** PHP has a large and active community of developers who contribute to its development and maintenance. The PHP community provides a wealth of resources, including documentation, tutorials, and forums, making it easier for developers to learn and use PHP.

## TOOLS/PLATFORM REQUIRED

### 1. Local Development Environment

To simulate a live server on your local machine, you'll need a software stack that includes Apache, MySQL (or MariaDB), and PHP.

- **XAMPP:** A free, open-source cross-platform web server solution stack package developed by Apache Friends, consisting mainly of the Apache HTTP Server, MariaDB database, and interpreters for scripts written in PHP and Perl.

### 2. Code Editor

A code editor is essential for writing and editing your PHP, HTML, CSS, and JavaScript code.

- **Visual Studio Code (VS Code):** A free, open-source editor with features like syntax highlighting, IntelliSense, and extensions for PHP and MySQL.

### 3. Database Management Tool

To manage your MySQL database:

- **phpMyAdmin:** A free and open-source administration tool for MySQL and MariaDB,

offering a web-based interface to perform database tasks.

#### **4. Web Browser**

To test and view your application:

- **Google Chrome:** Offers developer tools to inspect and debug your code.
- **Mozilla Firefox:** Provides similar developer tools and is known for its performance.
- **Microsoft Edge:** Built on Chromium, offering modern web standards and developer tools.

#### **5. Operating System**

**Minimum:**

- **Windows:** Windows 7
- **macOS:** macOS Sierra (10.12) or later
- **Linux:** Ubuntu 18.04 or later

**Recommended:**

- **Windows:** Windows 10 or 11
- **macOS:** macOS Big Sur (11.0) or later
- **Linux:** Ubuntu 20.04 or later
- **Mobile:** Android 11.0 or later, iOS 14.0 or later

## 6.HARDWARE & SOFTWARE REQUIREMENTS

### Hardware Requirements:

#### Client Side:

<b>RAM</b>	512 MB
<b>Hard disk</b>	10 GB
<b>Processor</b>	1.0 GHz

#### Server side:

<b>RAM</b>	<b>1 GB</b>
<b>Hard disk</b>	<b>20 GB</b>
<b>Processor</b>	<b>2.0 GHz</b>

### Software Requirement:

#### Client Side:

<b>Web Browser</b>	Google Chrome or any compatible browser
<b>Operating System</b>	Windows or any equivalent OS

## PROBLEM DEFINITION

The current manual process of boat rentals is inefficient, time-consuming, and prone to human errors. Customers often need to physically visit booking centers or rely on phone calls to check boat availability, which lacks transparency and causes inconvenience. Similarly, boat operators face difficulty managing schedules, avoiding double bookings, and keeping accurate records of reservations. There is also a lack of centralized access to real-time booking data, making it harder to track operations and respond to customer queries effectively.

Hence, a web-based Boat Booking System is required to automate and streamline the entire rental process, ensuring faster service, better accuracy, and improved user satisfaction.

## REQUIREMENT SPECIFICATIONS

A Software Requirements Specification (SRS) is a complete description of the behavior and functionalities of the system to be developed. It outlines both the functional and non-functional requirements that define how the system should operate and what constraints must be considered during its development.

Functional requirements include a set of use cases describing all the interactions users will have with the system, such as booking a boat, managing boats, and handling bookings by admin or sub-admin.

Non-functional requirements impose limitations and expectations on performance, security, availability, and user interface.

### **The general requirements of the Boat Booking System are:**

- To allow customers to browse available boats and book based on preferences.
- To provide real-time availability status of boats to avoid double bookings.
- To enable admins to manage boats, view bookings, and generate reports.
- To maintain secure login access for admin and sub-admin users.
- To record and store customer booking data with appropriate validation.
- To integrate a secure payment system for smooth online transactions.
- To allow customers to cancel bookings and receive status notifications.
- To back up important data and ensure information is not lost.
- To provide a responsive and user-friendly interface for easy access.

## PROJECT PLANNING & SCHEDULING

Project planning is part of project management, which relates to the use of schedules such as Gantt charts to plan and subsequently report progress within the project environment.

Initially, the project scope is defined and the appropriate methods for completing the project are determined. Following this step, the durations for the various tasks necessary to complete the work are listed and grouped into a work breakdown structure. The logical dependencies between tasks are defined using an activity network diagram that enables identification of the critical path. Float or slack time in the schedule can be calculated using software. Then the necessary resources can be estimated and costs for each activity can be allocated to each resource, giving the total project cost. At this stage, the project plan may be optimized to achieve the appropriate balance between resource usage and project duration to comply with the project objectives. Once established and agreed, the plan becomes what is known as the baseline. Progress will be measured against the baseline throughout the life of the project. Analyzing progress compared to the baseline is known as earned value management.

The PROJECT SCHEDULE is a calendar that links the tasks to be done with the resources that will do them. Before a project schedule can be created, the project manager must have a work breakdown structure (WBS), an effort estimate for each task, and a resource list with availability for each resource. If these are not yet available, it may be possible to create something that looks like a schedule, but it will essentially be a work of fiction. A project manager's time is better spent on working with the team to create a WBS and estimates (using a consensus-driven estimation method like Wideband Delphi than on trying to build a project schedule without them. The reason for this is that a schedule itself is an estimate: each date in the schedule is estimated, and if those dates do not have the buy-in of the people who are going to do the work, the schedule will almost certainly be inaccurate.

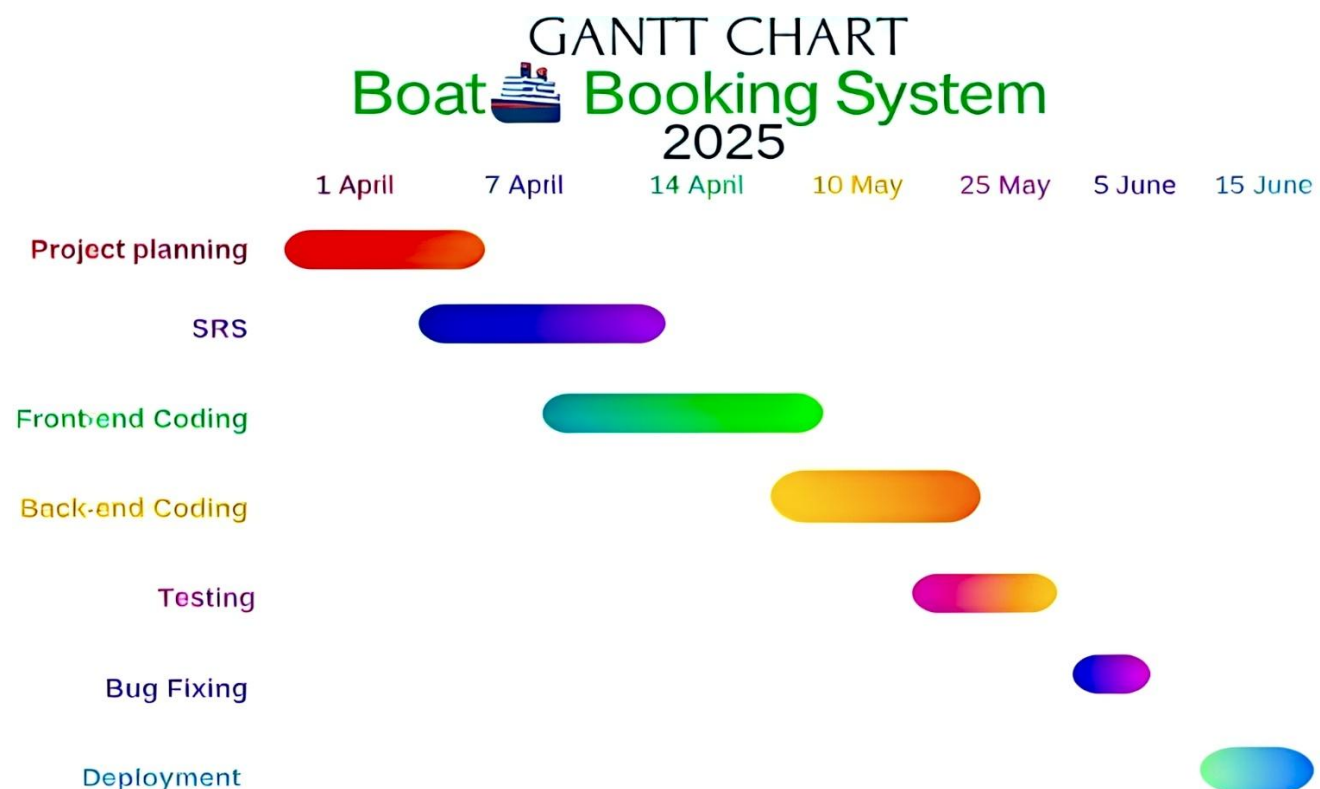

## GANTT CHART

Gantt charts (developed by Henry L. Gantt) are a project control technique that can be used for various purposes, including scheduling, resource planning, and monitoring progress. A Gantt chart is a type of bar chart, where each bar represents a specific activity or task involved in the project.

The bars are drawn against a time axis, and the length of each bar is proportional to the time duration planned for that activity. Gantt charts can vary in appearance depending on their purpose but are commonly used in software projects for time management and progress tracking.

The Gantt chart for the Boat Booking System project is created to manage the different phases of development like requirement analysis, designing, coding, testing, and deployment.

## SYSTEM ANALYSIS

### 1. Understanding the Need

Managing boat bookings manually is slow, confusing, and often leads to mistakes like double bookings or missing customer details. Customers find it difficult to check availability or confirm bookings quickly. There is no single system to handle everything easily. So, a web-based Boat Booking System is needed to save time, reduce errors, and make the process smooth for both customers and boat operators.

### 2. Requirement Engineering Process

The requirement engineering process for the Boat Booking System includes the following basic steps:

- Requirement Elicitation: Collect needs from customers and boat owners.
- Requirement Analysis: Review and prioritize the gathered requirements.
- Requirement Specification: Document the final list of features and functions.
- System Modeling: Create diagrams to show how the system will work.
- Requirement Validation: Check if the requirements match user needs.
- Requirement Management: Handle any updates or changes during the project.

### **3. Approach Taken**

We conducted basic discussions and feedback sessions with:

Boat owners and operators about their booking management needs

Admin users who manage the boats and reports

Customers who rent boats through the system

The goal was to understand the problems they face in the current manual process and what features they expect in a modern, digital boat booking system.

### **4. Key Question Asked**

- Who will use the system?
- What information needs to be stored and accessed?
- How should the user interface look and function?
- What security measures are necessary?
- Are there existing systems or tools to integrate with?

### **5. Preliminary Investigation**

We examined:

- The feasibility of developing the system using technologies like PHP, MySQL, and Laravel.
- Challenges faced with manual record-keeping.
- Cost-benefit analysis of developing a custom system versus using existing

## **Solutions.**

### **1. Objectives of Preliminary Investigation**

- Understand the full scope of the boat booking system project.
- Estimate time, cost, and resources required for development.
- Identify potential risks and challenges during implementation.
- Confirm the technical feasibility using web-based technologies like PHP and MySQL.

### **2. Information Gathering Techniques Used**

- Reviewed existing boat booking systems to understand common features, limitations, and user needs.
- Observed daily operations of boat rental businesses, including how bookings are handled and recorded manually.
- Conducted interviews with boat operators, admins, and users to collect feedback on challenges they face and expectations from a digital booking system.

## FEASIBILITY STUDY

Not everything imaginable is feasible, not even in software, even as it may appear to outsiders. Feasibility is the determination of whether or not a project is worth doing. On the contrary, software feasibility has seven solid dimensions as below: -

- **Technical feasibility.**
- **Operational feasibility.**
- **Economic feasibility.**
- **Social feasibility.**
- **Management feasibility.**
- **Legal feasibility.**
- **Time feasibility.**

The process followed in making this determination is called a feasibility study. The type of study determines if a project can and should be taken. Once it has been determined that a project is feasible, that analyst can go ahead and prepare the project specification which finalizes project requirements. Generally, feasibility studies are undertaken within tight time constraints and normally culminate in a written and oral feasibility report. The contents and recommendation of such a study will be used as a sound basis for deciding whether to proceed, postpone or cancel the project. Thus, since the feasibility study may lead to the commitment of large resources, it becomes

necessary that it should be conducted competently and that no fundamental errors of judgment are made.

In other words we can say that a feasibility study is conducted to select the best system that meets performance requirements. This contains an identification description, an evaluation of the candidate system and the selection of the best system for the job. The system required a statement of constraints; the identification of specific system objectives and a description of outputs define performance.

---

#### TECHNICAL FEASIBILITY: -

Technical feasibility is concerned with specifying equipment and software that will successfully satisfy the user requirements. My project is fit in technical feasibility because

- All technologies are open-source and widely used.
- Easy availability of web servers like XAMPP/WAMP.
- Good documentation and community support.
- Can be hosted on shared servers or cloud platforms.

---

#### ECONOMICAL FEASIBILITY: -

Economic analysis is the most frequently used technique for evaluation of the effectiveness of a proposed system. More commonly known as Cost/Benefit analysis, the procedure is to determine the benefits and savings that are expected from a proposed system and compare them with costs.

If benefits outweigh costs, a decision is taken to design and implement the system. Otherwise, further justification or alternatives in the proposed system will have to be made if it has a chance of being approved. This is an ongoing effort that improves in accuracy at each phase of the system life cycle.

My project is fit in technical feasibility because

- Low development cost due to open-source tools.
- Minimal hosting cost for deployment.
- No licensing cost involved.

Benefits:

- Reduces manual work and paper-based processes.
- Saves time and cost in long term operations (booking, billing, reports).

---

#### **OPERATIONAL FEASIBILITY: -**

Operational feasibility assesses whether the proposed system will function in the intended environment.

My project is fit in operational feasibility because

- Easy to use for admins, boat operators, and customers.
- Provides modules like boat booking, boat management, user registration, and report generation.
- Can be accessed anytime by authorized staff for daily booking operations.

**Considerations:**

- Proper training might be needed for staff.
- User-friendly UI with validation to reduce errors.

---

#### MANAGEMENT FEASIBILITY: -

This checks whether the management will support the project.

My project is fit in management feasibility because:

- Management is likely to support it due to reduced manual work and increased booking efficiency.
- Provides better reports and booking data for decision-making.
- Helps improve customer service and the reputation of the boat rental business.

---

#### SOCIAL FEASIBILITY: -

This evaluates whether the project is acceptable to the people (admins, customers, boat operators) using it.

My project is fit in social feasibility because:

- Enhances convenience for customers (online boat booking, instant confirmation).
- Reduces waiting time and booking confusion.
- Improves admin-customer interaction with better booking record availability.

---

#### LEGAL FEASIBILITY: -

Legal feasibility ensures that the system complies with all relevant laws and regulations.

My project is fit in legal feasibility because

- Use HTTPS and secure login.
- Implement role-based access control.
- Keep customer data encrypted and confidential.

---

#### TIME FEASIBILITY: -

Time feasibility determines if the project can be completed within the available time frame.

My project is fit in time feasibility because

- Basic MVP (minimum viable product) can be built within weeks.
- Modular development possible (booking → customers → billing, etc.).
- Faster development using PHP and MySQL compared to enterprise solutions.

Timeframe Estimate:

- Basic boat booking version (single admin & user): 2–4 weeks.
- Full-featured version (with sub-admins, reports, payment): 1–2 months depending on features.

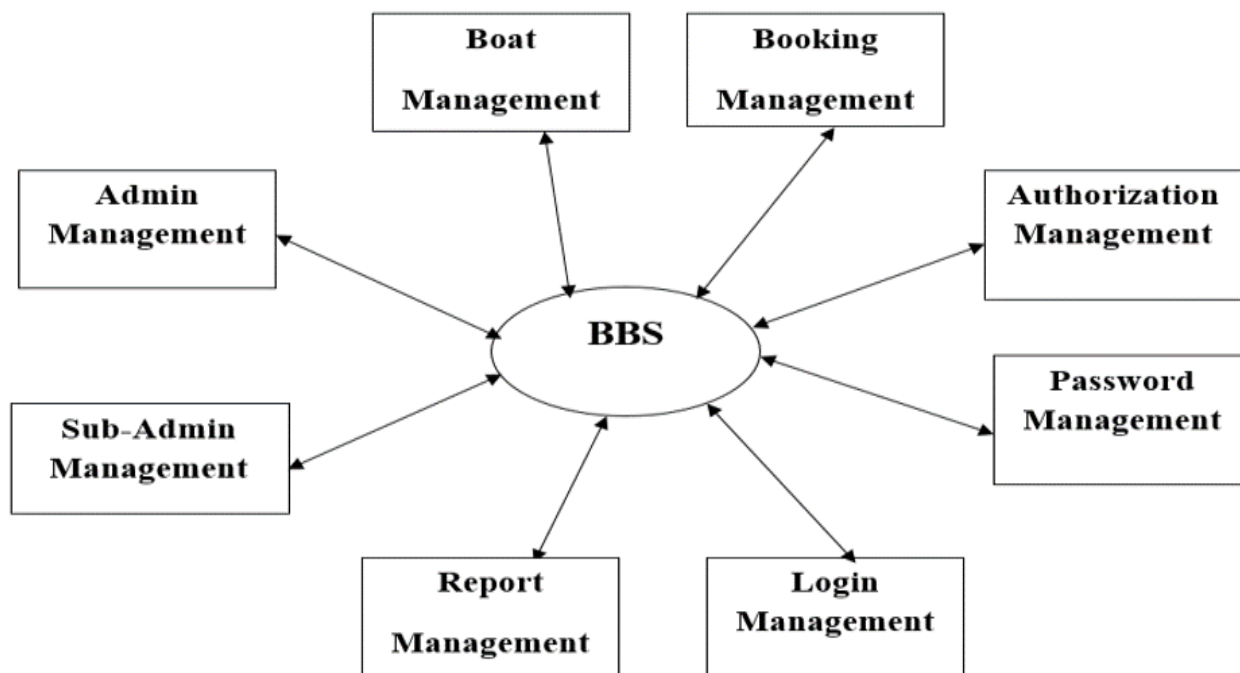

## ANALYSIS

System Analysis refers to the process of examining a situation with the intent of improving it through better procedures and methods. System Analysis is the process of planning a new System to either replace or complement an existing system.

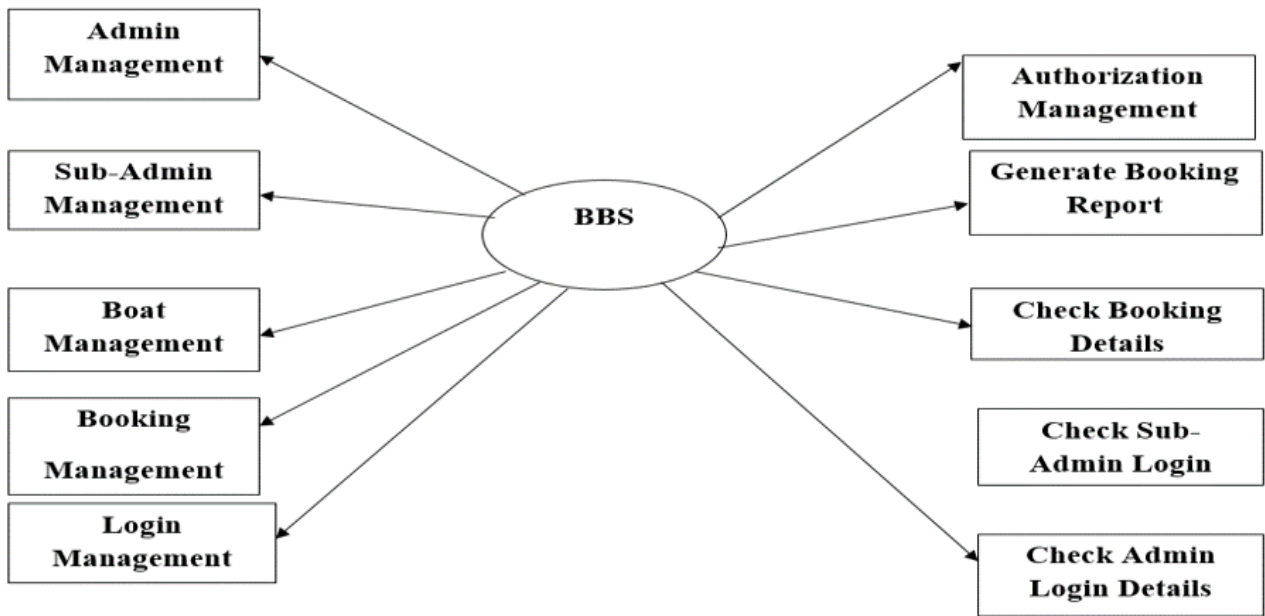

## DFD

The DFD is an excellent communication tool for analysts to model processes and functional requirements. Used effectively, it is a useful and easy to understand modeling tool. It has a broad application.

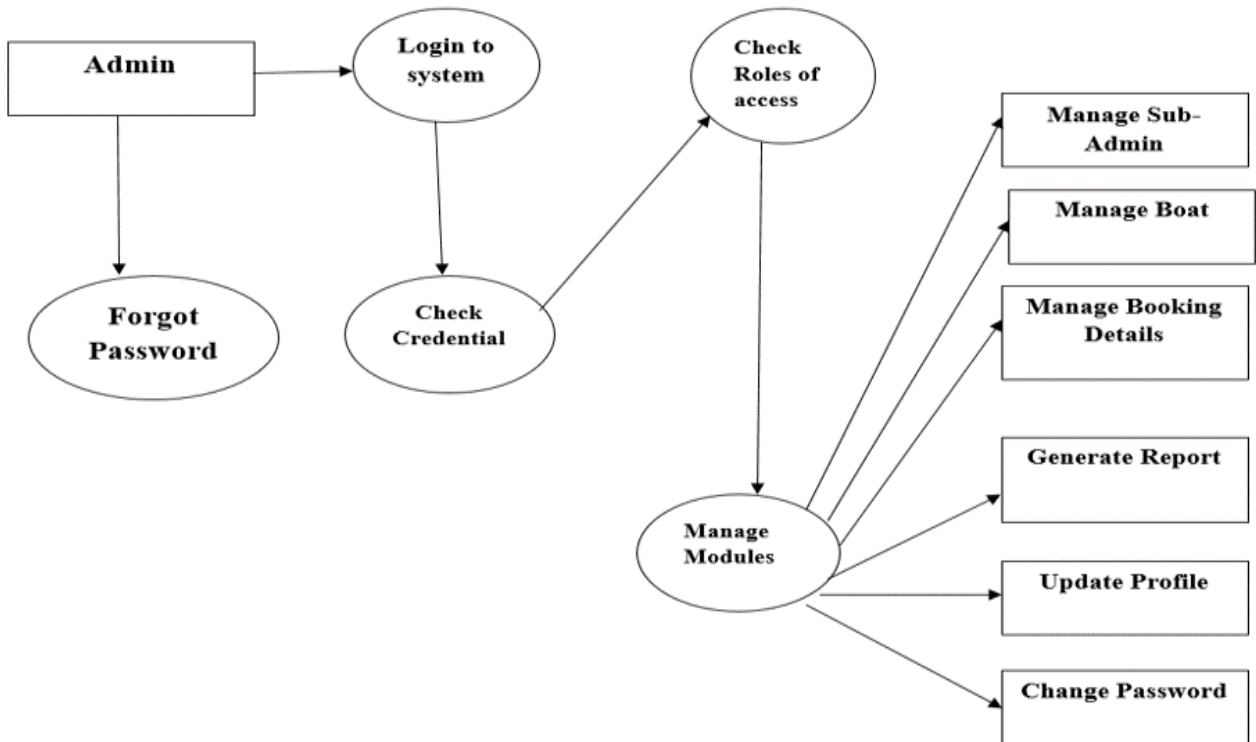

### Zero Level DFD

First Level DFD

Second Level DFD

## MODULE DESCRIPTION

Boat Booking System is a web application that allows customers to book boats online and lets admins manage boats, bookings, and users. In this project, we use PHP and MySQL database. The entire project mainly consists of 3 modules, which are:

- Admin Module
- User Module
- Sub-Admin Module

### Admin module:

- **Dashboard:** In this section, admin can view total boats, bookings, accepted bookings, and new booking requests.
- **Boat Management:** Admin can add, update, or delete boat details.
- **Sub-Admins:** Admin can create, manage, and reset passwords for sub-admins.
- **Bookings:** Admin can view booking requests and take actions (accept/reject).
- **Reports:** View booking reports between selected dates.
- **Profile & Password:** Admin can update his profile and change password.

### User Module (Customer)

- **Dashboard:** Users can view their profile and booking status.
- **Boat Booking:** Users can view available boats and make a booking.
- **Booking History:** Users can check the status and history of their bookings.

### Sub-Admin Module:

- **Dashboard:** View total bookings and their statuses (new, accepted, rejected).
- **Boat Management:** Sub-admins can add, update, or delete boats.
- **Booking Management:** Can view and manage user bookings.
- **Reports:** Generate booking reports based on dates.
- **Profile & Password:** Can update profile and change password.

## DATA STRUCTURE SNAP SHOT

**DATA DICTIONARY:** -The data dictionary stores descriptions of data items, structures, and how they relate to system processes. A data dictionary used for database design in this project is mentioned. Care was taken during the database design to allow future expansion based on the growing needs of the boat rental system.

## PROCESS LOGIC DIAGRAM OF BBS

## SCOPE AND FUTURE ENHANCEMENT

The scope of a Boat Booking System is wide and can be customized to suit the specific needs of boat rental businesses. With its ability to improve customer service, streamline operations, and digitally manage bookings, this system is an essential tool for modern boat rental services.

- ❖ The future scope of this system is also promising as tourism and online booking services continue to grow with digital transformation.
  - Integration with Artificial Intelligence (AI) for dynamic pricing and customer insights.
  - Support for virtual boat tours or video previews before booking.
  - Integration with travel portals or tour packages for broader customer reach.
  - Accessible design for elderly or differently-abled users.
  - Real-time tracking of boat availability and maintenance schedules.
  - Mobile apps for Android/iOS and real-time notifications for bookings, cancellations, etc.

## IMPLEMENTATION METHODOLOGY

Implementation of a tested system is done on the actual location with the actual hardware, software, and users in place. To implement this Boat Booking System, the following are necessary:

- A live web server or hosting platform
- Proper domain setup for customer access
- Access for admins, sub-admins, and customers
- Real-time testing with actual booking data and boat listings

This project runs on the internet or intranet, so I have to select internet supportive software. For implementing this software a web-server is required. I have to install IIS (internet information service). Know this project is web-based so it will need a web-browser which will act as its interface, so for this project install a web-browser capable of providing proper interface to this project such as internet Explorer/mozilla Firefox/opera etc, and many other browser and for back-end operation, I have to install ORACLE 9i which handle all the work related to database query and updation as required by the software. In future also use better databases. We know that this project will be developed on heavy platform ASPJAVA with c#, so there is a requirement of an advanced processor and proper RAM and other advanced Hardware configuration.

- ✓ Create a separate user for this application: A user named as “admin” with the password “pass” is to be created for storing the data in a separate place. Storing data under a separate user will protect the data. Oracle Navigator can be used for creating the said username and password.
- ✓ Create required tables: The structure of tables required for this project (Detail given in the database design section) is to be created in the said user. The SQL statement CREATE can be used for creating such tables.

## TESTING

**Software testing consists of the following stages.**

**a) TEST PLAN DEVELOPMENT:-**

The importance of software testing and its implications need not be emphasized. Software testing is a critical element of software quality assurance and represents the ultimate review of specifications, design and coding. The main objective of testing is to uncover a host of errors, systematically, with minimum effort and time. It improves the reliability of the software.

**b) TESTING STRATEGY:-**

A testing strategy explains how to conduct a test to uncover all the errors with minimum possible time and effort. It should be flexible enough to promote customization that may be necessary in due course of the development process.

**c) UNIT TESTING:-**

Unit testing focuses verification effort on the smallest unit of a software module using the detailed design criteria. Process specifications testing are done to uncover errors within the boundaries

of module. All modules must be successful in the unit test before the start of the integration testing. The software developed for e-banking is tested module wise by giving normal values and extreme values as input. All the bugs have been identified and removed. The software designed is tested module wise. Before using the software, an employee has to give the organization name and password.

In the next stage he has to provide division name, employee ID and password. If any of this information is wrong, the system gives an error message- “invalid user and password”

### **INTEGRATION TESTING:-**

It is a systematic technique for constructing different program modules into an integrated software structure. This test uncovers the errors during the integration process. The integration aspect is tested after integrating all the modules and validated.

### **VALIDATION TESTING:-**

After the culmination of integration testing the software is ready as per the specification. But it has to be validated as per the specification and to uncover the unexpected future errors and to improve its reliability. The random value and boundary values as input is fed to the software developed and studied the software performance and validated

## **TEST CASE DESIGN**

The techniques that are used in deriving the test cases are explained below.

### **CONDITION TESTING:-**

Condition testing is a test case design method that exercises the logical conditions contained in the program. The possible components in a condition statement are a Boolean operator, Boolean variable, relational operator, arithmetic expression and parenthesis.

### **BOUNDARY VALUE ANALYSIS:-**

Boundary value analysis leads to the selection of test cases that exercise the boundary conditions or boundary values. It is observed that a large number of errors tend to appear at the boundaries of the input domain than in the center. The boundary condition is tested by inserting values beyond specification/availability of project allocations.

### **EQUIVALENCE PARTITIONING:-**

Equivalence partitioning is a black box testing method that divides the input domain of a program into classes of data from which test cases can be derived. A typical test uncovers a class of errors that might otherwise require many more test cases before the error is observed. Equivalence classes for input determine the valid and invalid inputs for the program

## **LIMITATIONS AND FURTHER ENHANCEMENTS**

### **LIMITATIONS:**

Despite its usefulness, the Boat Booking System has a few limitations and challenges in its current version:

- Reliability of online payment gateways can affect transaction success.
- Lack of integration with other travel or rental systems, which may limit broader usage.
- Requires internet access, which may not be available in remote locations.

### **RECOMMENDED AREAS FOR FURTHER RESEARCH**

As online booking and tourism services continue to evolve, there are several areas that can be explored to enhance this system:

1. Integration with GPS tracking, automatic boat availability updates, and mobile app-based check-ins.
2. Research into standardized APIs for integrating the system with external travel platforms and payment services.
3. Development of internal data formats and communication protocols for smoother integration with future modules like feedback systems, review analytics.

## SECURITY MECHANISM

Implementation of security is a key issue in any software development. Different applications use different kinds of security mechanisms according to their needs.

In the Boat Booking System, the implementation of security has been applied at the user level.

The system authenticates users through username and password before granting access to the system's features.

Only authorized users with valid User ID and Password can access the system.

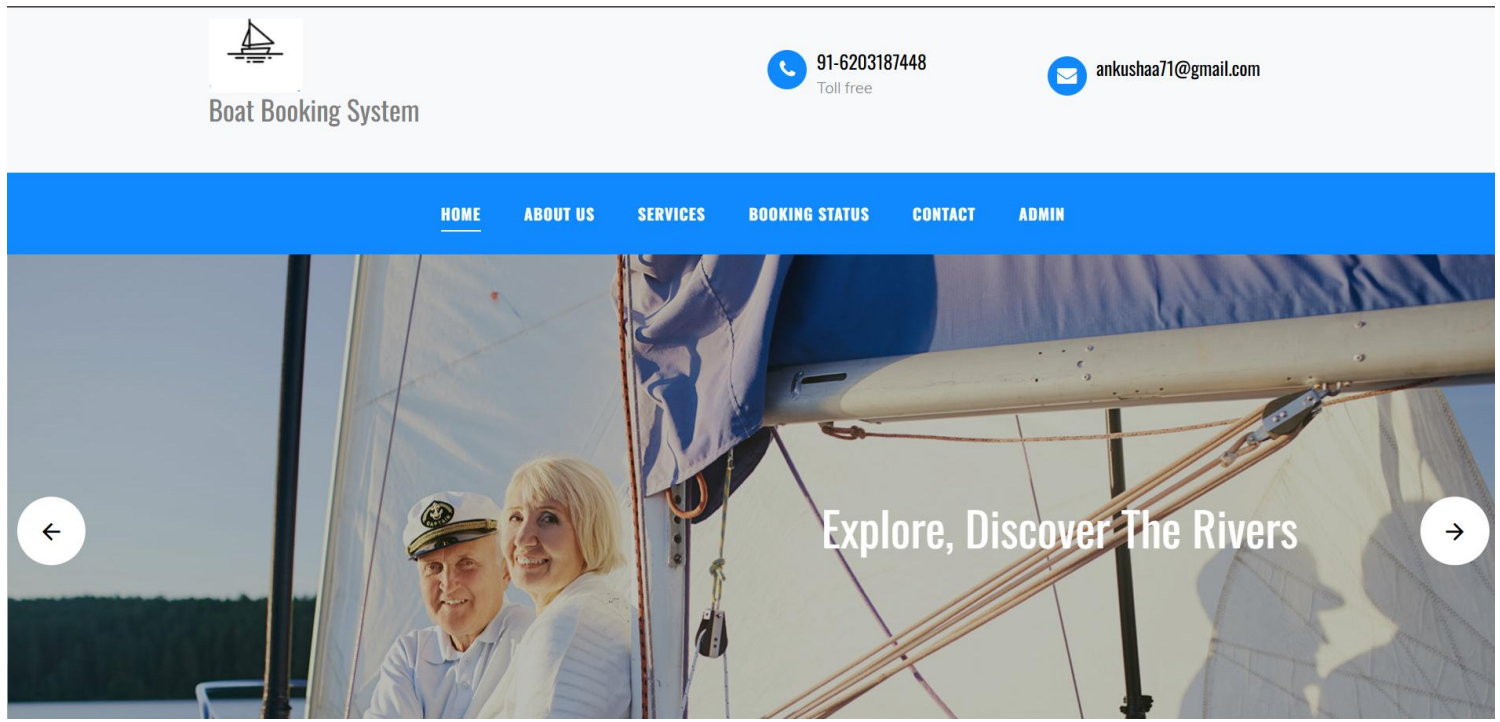

The admin is responsible for creating or removing users and managing access rights.

At the data level, validations and constraints ensure only valid data is stored in the database.

The system includes an authentication mechanism, and users can change their passwords.

Passwords are stored as VARCHAR, allowing both letters and numbers for stronger security.

## PROJECT OUTPUT SCREEN

*About Us*

### Welcome To Our Website

Discover the perfect escape on the water with our premium boat booking service. Whether you're looking for a peaceful cruise or a fun-filled adventure, we're here to make it special and hassle-free.

Let the waves carry your worries away. With comfort, safety, and style at the heart of our service, your unforgettable journey starts here.
